Plan: add `farewell(name)` to greet.js

Context

`greet.js` currently exports a single function, `greet(name)`, which returns `"Hello " + name`. We want a matching `farewell(name)` so callers can also say goodbye.

Steps

1. **Add the function.** In `greet.js`, add an exported `farewell(name)` below `greet`. It follows the same style: it returns a string and doesn't log or print anything.
2. **Match the existing format.** Build the message the way `greet` does, by concatenating `"Goodbye "` and `name`. This keeps the two functions consistent.
3. **Verify.** Import `farewell` and check that `farewell("Ada")` returns `"Goodbye Ada"`. Check that `greet` still works.
4. **Add a small unit test.** Write a short test for `farewell` that asserts `farewell("Ada")` equals `"Goodbye Ada"`. Use whatever test runner the project already uses, or Node's built-in `node:test` if there isn't one.
5. **Document it.** Add a short entry for `farewell(name)` to `README.md`, with its signature and an example call and result. If the README already documents `greet`, put the new entry next to it in the same format.
